General Description

The CD4051BC, CD4052BC, and CD4053BC analog multiplexers/demultiplexers are digitally controlled analog switches having low "ON" impedance and very low "OFF" leakage currents. Control of analog signals up to $15V_{p-p}$ can be achieved by digital signal amplitudes of 3–15V. For example, if V_{DD} = 5V, V_{SS} = 0V and V_{EE} = –5V, analog signals from –5V to +5V can be controlled by digital inputs of 0–5V. The multiplexer circuits dissipate extremely low quiescent power over the full V_{DD}–V_{SS} and V_{DD}–V_{EE} supply voltage ranges, independent of the logic state of the control signals. When a logical "1" is present at the inhibit input terminal all channels are "OFF".

CD4051BC is a single 8-channel multiplexer having three binary control inputs. A, B, and C, and an inhibit input. The three binary signals select 1 of 8 channels to be turned "ON" and connect the input to the output.

CD4052BC is a differential 4-channel multiplexer having two binary control inputs, A and B, and an inhibit input. The two binary input signals select 1 or 4 pairs of channels to be turned on and connect the differential analog inputs to the differential outputs.

CD4053BC is a triple 2-channel multiplexer having three separate digital control inputs, A, B, and C, and an inhibit input. Each control input selects one of a pair of channels which are connected in a single-pole double-throw configuration.

Features

- Wide range of digital and analog signal levels: digital 3 – 15V, analog to $15V_{p-p}$
- Low "ON" resistance: 80Ω (typ.) over entire $15V_{p-p}$ signal-input range for $V_{DD} - V_{EE}$ = 15V
- High "OFF" resistance: channel leakage of ±10 pA (typ.) at $V_{DD} - V_{EE}$ = 10V
- Logic level conversion for digital addressing signals of 3 – 15V ($V_{DD} - V_{SS}$ = 3 – 15V) to switch analog signals to 15 V_{p-p} ($V_{DD} - V_{EE}$ = 15V)
- Matched switch characteristics: ΔR_{ON} = 5Ω (typ.) for $V_{DD} - V_{EE}$ = 15V
- Very low quiescent power dissipation under all digital-control input and supply conditions: 1 μ W (typ.) at $V_{DD} - V_{SS} = V_{DD} - V_{EE}$ = 10V
- Binary address decoding on chip

Special Considerations

In certain applications the external load-resistor current may include both V_{DD} and signal-line components. To avoid drawing V_{DD} current when switch current flows into IN/OUT pin, the voltage drop across the bidirectional switch must not exceed 0.6V at $T_A \leq 25°C$, or 0.4V at $T_A > 25°C$ (calculated from R_{ON} values shown). No V_{DD} current will flow through R_L if the switch current flows into OUT/IN pin.
