

COMPANDER IC FOR CORDLESS TELEPHONE

FEATURES

- Low operating supply voltage and small consumption current make this IC suitable for its application to the sets using the battery such as the codeless telephone set. etc.

$$V_{CC}(\text{MIN}) = 1.8\text{V} \quad (T_a = 25^\circ\text{C})$$

$$I_{CCQ} = 2.7\text{mA} \quad (\text{Typ.}) \quad (V_{CC} = 3\text{V}, T_a = 25^\circ\text{C})$$

- For noise reduction, compressor and expander are incorporated into a package.
- Wide operating supply voltage range : $V_{CC} = 1.8 \sim 9\text{V}$
- Recommendable operating supply voltage : $V_{CC} = 3\text{V}$
- Difference between TA31101P, TA31101F and TA31101AP, TA31101AF

NAME OF PRODUCT	INPUT REFERENCE LEVEL (Typ.)
TA31101P, TA31101F	-18.5dBV
TA31101AP, TA31101AF	-20.0dBV

Weight DIP16-P-300A : 1.1g (Typ.)
SSOP16-P-225 : 0.14g (Typ.)

No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.

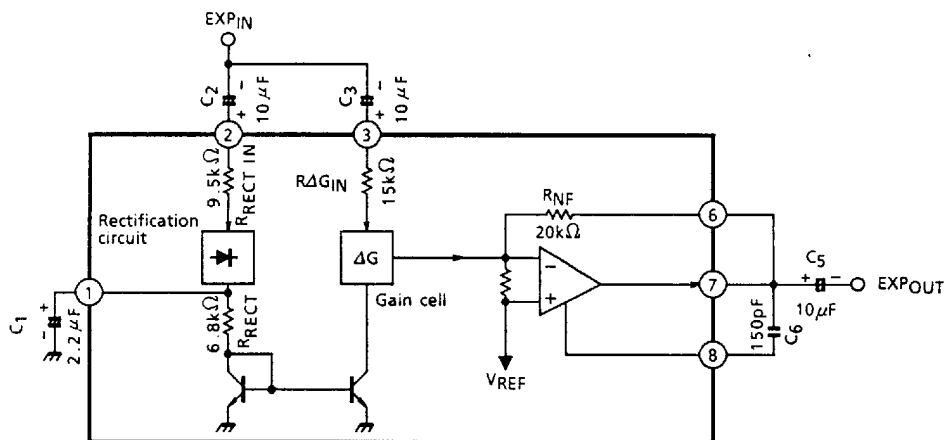

© These TOSHIBA products are intended for use in general commercial applications (office equipment, communication equipment, measuring equipment, domestic appliances, etc.). please make sure that you consult with us before you use these TOSHIBA products in equipment which requires extraordinarily high quality and/or reliability, and in equipment which may involve life threatening or critical application, including but not limited to such uses as atomic energy control, airplane or spaceship instrumentation, traffic signals, medical instrumentation, combustion control, all types of safety devices, etc. TOSHIBA cannot accept and hereby disclaims liability for any damage which may occur in case the TOSHIBA products are used in such equipment or applications without prior consultation with TOSHIBA.

The compressor and the expander of this IC are individually composed of the rectification circuit, the gain cell and the operation amplification circuit as shown in the figure below.

Compressor

Expander

1. Rectification circuit

In this circuit, the feedback-type full-wave rectification circuit is applied for improving the precision of detection, and the response characteristics (attack time, recovery time) are determined by the time constant of the smoothing capacitor of the rectifying output current connected to the E-RECT terminal and the C-RECT terminal (pin 1, pin 16) and by the time constant of the internal resistance of IC.

- The internal resistance of E-RECT terminal and C-RECT terminal (pin 1, pin 16) becomes the series resistance of the R-RECT 6.8Ω and the emitter resistance r_e in the current miller circuit. The emitter resistance r_e of transistor varies according to the signal level as shown below.

$$3 \cdot \frac{V_{IN} (AVG)}{R_{RECT IN}} = I_{RECT} (AVG)$$

$$r_e = \frac{V_T}{I_{RECT} (AVG)} (\Omega)$$

$V_{IN} (AVG)$: Mean input signal voltage
 $I_{RECT} (AVG)$: Mean rectification output
 r_e : Emitter resistance
 V_T : Approx. 26mV
 (At room temperature)

- The input resistance of the input E-RECT_{IN} terminal and C-RECT_{IN} terminal (pin 2, pin 15) of the rectification circuit is approximately $9.5k\Omega$.

2. Gain cell (ΔG)

This circuit is a variable gain amplifier for controlling the gain with the rectification output current of the rectification circuit.

The input resistance of the input E- ΔG_{IN} terminal and C- ΔG_{IN} terminal of the gain cell (pin 3, pin 14) is approximately $15k\Omega$.

3. Operation amplification circuit

In the compressor, since the variable gain amplifier is involved in the feedback loop of the operation amplification circuit, the oscillation is liable to be generated, however, in this circuit, since the C-Cp terminal (pin 9) for phase compensation is provided, the countermeasure can be taken against the oscillation through the external capacitor.

In the compressor, for making the current gain maximum, the capacitor for decoupling the current signal is connected to the C-NF terminal (pin 12).

The cut-off frequency of the compressor is determined by the product of the capacitor C_{10} connected to the C-NF terminal multiplied by R_{NF} $20k\Omega$ of the internal resistance.

The cut-off frequency is obtained by the expression below.

$$f_C = \frac{1}{2\pi \cdot C_{10} \cdot R_{NF}}$$

MAXIMUM RATINGS (Ta = 25°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	V _{CC}	10	V
Power Dissipation	P _D	1000 370	mW
Operating Temperature	T _{opr}	-25~75	°C
Storage Temperature	T _{stg}	-55~150	°C

ELECTRICAL CHARACTERISTICS (Unless otherwise specified, V_{CC} = 3V, f = 1kHz, Ta = 25°C, 0dB = -20dBV)

CHARACTERISTIC		SYMBOL	TEST CIRCUIT	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Supply Voltage		V _{CC}	—	—	1.8	3.0	9.0	V
